100% Plagiarism

Input Text

Plagiarism detection usually works by checking the entire internet for key words or phrases in the body of text that are useful to identify possible sources of the text content. This is both useful for detecting plagiarism as well as finding possible sources. The other way plagiarism detection works is by checking a large body of submitted documents. This method requires a large database of text works which are typically only available to the main organization that owns and publishes those works. Our plagiarism detector works by searching the internet database for potential plagiarised sources to determine if the content is unique or plagiarized.
